## Entertainment trivia questions and answers printable

While the word geography is derived from the Greek word and literally means to write about the earth, the topic of geography is more than describing foreign places or remembering the names of capitals and nations. Geography is an all-inclusive discipline that seeks to understand the world - its human and physical features - through an understanding of location and location. Geographies see where everything is and how they get there. My favorite definition for geography is the bridge between human science and physics and the mother of all science. Geography looks at the connection of space between people, places and earth. Many people have an idea of what a geosolymmer does but don't have any idea of what a geographer does. While geography is often divided into human geography and physical geography, the differences between physical and geological geography are often confusing. Geographers tend to study the earth's surface, its landscape, its features and why they are in their place. Geological experts look deeper into the earth than geographers and study its rocks, the earth's internal processes (such as plate tectonics and volcanoes), and study periods of Earth's history millions and even billions of years ago. A higher education (college or university) in geography is an important start to becoming a geographer. With a bachelor's degree in geography, a geography student can start working in a variety of fields. While many students begin their careers after gaining a college education, others continue. Master's degrees in geography are useful for students who wish to teach at the high school or community college level, become a magrapher or GIS expert, about work in business or government. A PhD in geography (PhD) is necessary if one desires to become a full professor at a university. Although, many geographic doctors continue to establish consulting firms, become administrators in government agencies, or gain senior research positions in corporations or think-tanks. The best resource to learn about colleges and universities that offer geography degree is the annual publication of the American Association of Geographies, Guide to Geography Programs in the United States and Canada. Unfortunately, geographer job titles are often not found in companies or government agencies (with the most notable exception of the U.S. Bureau of Population Surveys). However, more and more companies are recognizing the skills that a geographically trained individual brings to the table. You'll find many geographer working as planners, car makers (map makers), GIS experts, analysts, scientists, researchers, and more. You'll also find many geographers working as lecturers, professors and researchers at schools, colleges and universities. Being able to see the world geographically is a basic skill for everyone. the relationship between and human, geographically linked science as diverse as geological, biological, and climatic studies with economic, historical, and politically based locations. Geographer understands conflicts around the world because there are many factors involved. The Greek scholar Eratosthenes, who measured the circometer of the earth and was the first to use the word geography, is often referred to as the father of geography. Alexander von Humboldt is often referred to as the father of modern geography and William Morris Davis is often referred to as the father of American geography. Taking geography courses, reading geography books, and, of course, exploring this site are great ways to learn. You can increase your geographic reading rate of places around the world by getting a good map, such as Goode's World Atlas, and use it to search for unfamiliar places anytime you meet them while reading or watching news. Before long, you will have a great knowledge of where the place is. Reading travelogues and history books can also help improve your geographic knowledge and understanding of the world - they are some of my favorite things to read. Everything is looking geographical! More and more schools across the United States are providing or requesting geography to be taught at all levels, especially high schools. The introduction of the Advanced Layered Human Geography course in high schools during the 2000-2001 school year increased the number of college-ready geography majors, thereby increasing the number of geography students in university programs. New geography teachers and professors are needed in all areas of the education system as more students begin to study geography. GIS (Geographic Information System) has become popular in many different fields and not just geography. Career opportunities for geographer with technical skills, especially in the GIS field, are excellent and should continue to grow. Tatiana Ayazo / Rd.com, ShutterstockYou may think this is a trick science quiz question. But, if you guessed that they weighed the same, you were wrong. A pound of heavier feathers. Why? Gold is weighed in the troy measurement system. Therefore, when you convert them into a unified system, a pound of gold weighs about 373.24 grams and a fur pound of about 453.59 grams. Like this brain challenge? Check out these historical questions that people always get wrong. Tatiana Ayazo/Rd.com, ShutterstockMany may think the answer to this scientific puzzle question is Mount Everest. However, Chimborazo Peak in Ecuador is the farthest from the center of the earth. Why? The earth actually bulges at the equator because it is constantly spinning. Since Chimborazo is located on top of the equator and just above this bulge, its apex is the farthest from the earth's core. Mount Everest is the highest mountain if you measure it from descent to peak, but its peak is not the farthest from the center of the earth. Tatiana Ayazo / Rd.com, Shutterstock Most people will say Goldfish only have a three-second memory, however, their memories actually last for several days. Goldfish have a classic conditioning learning procedure, which means that when they are given food in combination with another object, they remember both together and that memory can last for days. Tatiana Ayazo / Rd.com,shutterstockYou really do not have five senses - many neurosc scientists identify nine or more senses. Yes, there are five basics: touch, taste, smell, sight, and hearing, but there are also many senses in each year as well as some others. For example, indition is actually made up of several somatic senses, including heat, pain and pressure perception. One is the organic meaning, which is the feeling of your internal condition such as hunger or thirst. Want to learn more? Check out these puzzle questions and incredible facts basically everything. Tatiana Ayazo/Rd.com,shutterstockSo for the fact this scientific quiz is there, sharks can get cancer. And no, they can't cure cancer. Unfortunately, many still believe that shark cartilage can cure cancer, leading to the killing of sharks. It's wrong, and scientists now have evidence that there are sharks with tumors. Tatiana Ayazo / Rd.com,shutterstockIf you look down your veins, you will most likely answer blue to this question. Well, that's wrong. It really has a dark red color. Many people think that the blood is blue inside the body, but once it is exposed to oxygen outside the body, it turns red. However, even if deoxygenated, the blood contains hemoglobin, which is a red protein. Therefore, the blood inside your body is red. Your veins only look blue because of the way they reflect light. Don't miss out on other mind-blowing science events that you never learned at school. Tatiana Ayazo / Rd.com,shutterstockIf you answered not to this scientific quiz question, you were wrong. It is actually very likely that lightning will strike the same place twice. Lightning strikes the earth more than 1.5 billion times a year. Many places prone to lightning strikes, such as high-rise buildings, electricity poles or trees, are attacked several times a year. One example is the Empire State Building in New York City that is attacked dozens of times a year. Tatiana Ayazo/Rd.com,shutterstockThis is a tricky science quiz question. The answer is not your head though that's what most people think. You lose heat evenly throughout the body. In winter, most of your body temperature can escape through your head though, because it's the only part that isn't covered with clothes. So still wear a hat to keep warm. Tatiana Ayazo / Rd.com, ShutterstockNope, it's not to blend into their platform. There are actually many reasons why male chameleons will change color, but camouflage is not one of them - mood and temperature play a big role. If the chameleon is happy and tries to mate with the female chameleon, he will change color or if the temperature cools, which can cause to change color as well. Tatiana Ayazo/Rd.com, Shutterstock Many people think that the Great Wall of China is the only artificial object visible from space. This is really a myth unless you are in low orbit in a specific set of weather and light conditions, according to American science. Unfortunately, the composition of the Great Wall of Clay and Rock simply blends in too much of the surrounding landscape for anyone to make it out with an unsymed eye from orbit.
